Rainlendar_GetVariable and Rainlendar_SetVariable

Posted by Jorge_Luis - 2010/10/28 14:38

After my Circular calendar, i'm trying another layout.

```
 This work fine (GetVariable)
 alignment = Rainlendar_GetVariable(skin1, window1, "Alignment")
 This doesn't work (SetVariable)
 if alignment == "HORIZONTAL" then
    Rainlendar_SetVariable(skin1, window1, "Test", "0")
  else
    Rainlendar_SetVariable(skin1, window1, "Test", "1")
  end
```

Test is "1" by default, but it doesn't matter what the value of alignment is, after SetVariable "Test" keep as "1".

The problem isn't skin1 and window1, because i don't have any problem getting, but this not true when setting. (I'm trying to get/set %Show_weekdays% without user intervention)

By the way, looking for my errors on logfile i found this:

WARNING: The element already exists "font.small".
font.small is duplicated in widget addon. In shadow4 the size is 6, and in widget addon the size is 7.
WARNING: Unknown align: LEFT-TOP
According to item position, in "Horizontal Line Calendar" it says "LEFT-TOP" instead of "TOP-LEFT"
CTrayIcon::UpdateIcon(): Unable to find the image ""
The tray icon is trying to update, but i have none tray icon selected.

12:32:46: Category file: C:\Documents and Settings\MyUser\.rainlendar2\categories.ini
12:32:46: Warning: '/..' has extra '..', ignored.
12:32:46: DEBUG: Scanning folder for skins: c:\Archivos de programa\Rainlendar2\skins\
Something's happening between categories and skin scanner... but don't know what.

I'm uploading my calendars to http://jlourigse.comlu.com/rainlendar.html , there are some images of what i'm trying to do.

Yep, the Rainlendar_SetVariable() is broken. I'll fix that. I'll also get rid of (at least some of) the unnecessary errors in the log.

Nice work with the skin addons.

Thanks!
I hope someone use it from now on :P

In lastest version(b104), Rainlendar_SetVariable() does not work again, but the previous version(b103) works fine.

Ok, it's not possible to create new variables anymore but changing the value of an existing one should work still. I'll see what was changed.

Yes, my mean is that it can not change an existing one.

Ok, got it. The Rainlendar_SetVariable() changed the incorrect variable. I'll fix that.
