Rainlendar 2.8 BETA build 98

Posted by Rainy - 2010/11/13 08:04

Build 98 can be downloaded from here:

Windows (32-bit): Rainlendar-2.8.b98-32bit.zip
Windows (64-bit): Rainlendar-2.8.b98-64bit.zip
Linux TAR (32-bit): Rainlendar-2.8.b98-i386.tar.bz2
Linux DEB (32-bit): rainlendar2-pro_2.8.b98-1_i386.deb
Linux TAR (64-bit): Rainlendar-2.8.b98-amd64.tar.bz2
Linux DEB (64-bit): rainlendar2-pro_2.8.b98-1_amd64.deb
Mac OS X (Intel): Rainlendar-2.8.b98.dmg

MD5SUMS-b98

This is beta version! It has not been tested.

Changes:
o Changed the calendar selection to combo box. The "Allow multiple calendars" in advanced settings can be used to go back to the old way.
o Added "w" and "h" attributes for the days element in the calendar which can be used to define the size of the day in the free layout.
o Rainlendar_SetVariable() didn't work. Fixed.
o Added a special calendar called "" to the included/excluded calendar list which can be used to show/hide events which do not belong to any calendar.
o If the window fade duration is set to 0 the window is set immediately to opaque. This should help with the hidden windows on Linux.
o Added an advanced option to show/hide the tooltip in the tray.
o It's now possible to add a time offset for a calendar's events and tasks. This can be used e.g. for time zone adjustment.

Thanks! So many thanks, Rainy! :cheer:
The calendar works perfectly. And with the w field the icons show in the right place.

About the SetVariable...
Well, it works. It looks like the problem is changing the Show_weekdays variable. Look this code:

```
function Shadow4_Test_Initialize(skin, window)
   test = Rainlendar_GetVariable(skin, window, "Test")
   if (test == "Zero") then
     Rainlendar_SetVariable(skin, window, "Show_weekdays", 0)
     Rainlendar_SetItemValue(skin .. "::" .. window, "Horizontal Line Calendar.year", "Visible", 0)
   else
     Rainlendar_SetVariable(skin, window, "Show_weekdays", 1)
     Rainlendar_SetItemValue(skin .. "::" .. window, "Horizontal Line Calendar.year", "Visible", 1)
   end
   Rainlendar_Redraw(0)
end
```

Changing the value of test makes the year be visible/invisible. But this doesn't affect the weekdays. I tried setting 0 and "0", but is the same.
Could be that this doesn't work because Show_weekdays is in inside and year is inside directly?

I think the problem is that the variables are not evaluated again when Rainlendar_Redraw() is called so changes won't affect to the skin. What you can try is to change the variable's value in the configuration file (Rainlendar_SetOption("Variables/" .. skin .. "/" .. window, "Show_weekdays", "0")) and then call Rainlendar_Refresh().

Hello! Sorry to be so noob but how does one update? When I unzip file it gives files. Do I just replace all files in Rainlendar? Thanks!

Win7 64bit, Rainlendar Pro

That worked!!! B)
Now it works like it should. :laugh:

Something to mention: this time the file zlib1.dll was missing, but Rainlendar shows me no alert, however i unzip the archive above the old files.

What is "Allow multiple calendars"?
I try it and don't know what is changed...
Could give me a pic?

It's when you add a new event/task. In the bottom left there was the "calendars" button for multiples selections. Now, you can do that or just select only one calendar with the combo box.

I don't know if post this here or in Localization.
The spanish translation for "WORLD TIME" is "HORA MUNDIAL".

Thanks. I added the translation to the language pack.

I think I just discovered a little bug that probably isn't of relevance for most: If you install a language pack and then set categories, these categories are safed in the localized form (e.g. german "blau" instead of english "blue"). If you later switch back to english, these categories will not be read correctly and won't be displayed anymore (e.g. the entry is not colored blue despite having the category "blau"). Switching back to german solved the problem, though.

(I'm using beta 98, shadow 4 and google calendars on win 7 32bit if this is of any relevance)

Edit: One other thing: The german translation for "All following" is missing. It's "Alle Folgenden"

That isn't exactly a bug...
ics format isn't English, at least the content could be in another language, in your case German. I'm curious, why would you create an event in German and then change the app language to English?

But if you don't want to have troubles with the default categories (e.g. , , Birthday, Holiday) you could use the option "Store English category names" in Right click -> Options -> Advanced page -> General.

I have different calender windows from different skins and not all of them were localized, so instead of having a half German, half English interface I figured it's best to leave everything in English and switched back.

Now i'll try to localize the skins by myself in the next couple of weeks, it's better anyway. Thanks for the hint regarding storing the English category names!

Can you give a screenshot example of how this can be used? I travel frequently and was waiting for this kind of feature... Thanks!

You can change the time offset from the calendar's settings.

Hmm, but that's on a calendar basis...any idea how to have this on an event basis? Event 1 is created in timezone1 and event2 in timezone2, but the calendar/event list should show them in the local time zone.

Re:Rainlendar 2.8 BETA build 98
Posted by Rainy - 2010/12/15 12:56

Yes. But if you don't want to mess up your current installation you can extract the files to an empty folder and run the application from there.
