Auto icon attactment?
Posted by crazybee - 2010/11/19 05:45

I've just had a thought about something thats already on the calendar display app I use on my iPhone (Lockinfo with a old skin)

I know when adding a event though my iPhone that no icons are attached to the entry when viewed on rainlendar.

How about having rainlendar look for key words within an entry and automatically putting on the appropriate icon?

Say if I have an entry that got the word "Birthday" in when Rainlendar sees this word it automatically puts the birthday icon when viewed ?

Also be nice i this could also be user defined as well so people can set up there own icon hook ups I guess u could call it

What you folks think? or is this possible in current versions already?

I don't have an iPhone, but i though (and i think) that Rainlendar works the the Category keyword of the ics format (plain text), so no icon is attached always. If the Category is "Birthday" then Rainlendar search for the appearance of this category and if it has an icon, it showed.
Can you set the category in the iPhone?

Could you use the last beta? In the latest betas Raqinlendar has an option to set the icon for a category (but icons inside the app)

And with an app sync? There is a page with app for sync, but i don't remember where.

I don't know if this exactly helps you.

This works if the event is started in Rainlendar so u can select the category but if started in the iPhone it just comes up with no category.

Wanted to see if there was away to automate it on rain.

I make a suggestion:
Could you create a calendar for each kind of category in the iPhone?
There's an option the set automatically the "visual category" on Calendar tab in the options. and in advanced option you can find "visual category overrides normal category" in General section.

If you can't create separates categories then... i'm out of ideas.
