Network update unacceptably slow...
Posted by wernerb - 2011/01/26 19:05

Currently testing x64 V2.8, but have had this problem other versions. Actually none have worked correctly updating tasks/Events from shared calendar on another networked PC. It is running x32 V2.8. Works exceptionally local, but when I try to update a calendar on 2nd PC, takes literally 60 seconds to update and almost immediately shows 'Not Responding' in Application Taskbar.

I am running Win 7 x64 6GB, QuadCore 6600 Processor, system with calendar database is Win XP Pro, SP3, 2GB.

Both systems are linked with 1GB Router Wired (has wireless capabilities), we are hard-wired though, both systems have Comodo Firewall & ESET Antivirus. Disabling both have had no affect!

Can you attach the Rainlendar's debug log? I can check where the time is spent. I don't have two Windows computers but at least reads and writes to a Linux samba share from Windows are instantaneous.

Ok, Here it is after 2 simple edits to an event.

Also, tried changing file to a mapped drive, instead of using UNC to a unmapped drive e.g. \\dragon\os\etc.

Now a:\dragon\os\etc.

No affect on update speed.

Thanks.

Bill

P.S. was looking at log...what is "This component is ..." that is listed so many times with what looks like partial data of the events?" http://www.rainlendar.net/cms/images/fbfiles/files/rainlendar2-dc78beb89de78c2d76646a6137d6203d.log

Can you try if the build 102 works any better. I added buffering to the read function which could help with the issue.

I couldn't find that version; using x64 bit Windows b101 (latest??)

No change; all seems status quo.

Any ideas?

Bill

Is there any difference if you create a new empty calendar file on the network drive and add the event to there?

Ok, partial success. New Calendar (empty), adding new events/editing are instantaneous. However, after importing data from old calendar, same problem...how do I import data and maintain access speed ?

Thanks.

The problem is that reading the ics file in your system is really slow for some reason. If the file is empty there is not much to read so things work fine. It's really difficult for me to do anything about the problem without access to your system since I can't reproduce the problem myself.

What you can do is to keep your old events in a separate calendar and start using a new ics file for your current events. Setting up a ftp or http server to store the events would most likely help too.

Thanks for the info; found a better way...for me.

I've got SharePort on my router. I put the datafile on a usb key and updates on the network are now 1-2 secs.

Thanks.

Bill

P.S. Still really stumped on the delay in my systems/network. Oh well, I'll blame Microsoft! ha ha.
