
show only main window

Posted by pechorin - 2006/10/30 07:01

great work with the version 2!! it has all i missed in the previous version.

but i have a little problem, in the other version i had a hot key (ctrl+alt+c) to show the calendar then, if i wanted to see the date, i did that and it showed just the calendar window, when i clicked back on any other window, it went back again. but now, the only action i find is to "show windows", and it shows all the windows, year, sidebar, etc...

is it possible to have the action "show only calendar"?

thanks for your work

hide the other windows with alt+2 and alt+3 , and use alt+1 to hide/unhide the calendar window, is that wath you're looking for ?

edit: apparently, it hides, but doesn't unhide if you do this, bug???

thanks, but thats not what i am looking for really, it works, but only if the calendar is active, i want to use the shortcut from any other program.
thanks anyway

You can go to the advanced skin options and remove all the other windows except the calendar from the active side. After that the hotkey should hide/show only the calendar window.

The alt+N keys work only if one of the Rainlendar's windows has a keyboard focus. If you hide them all you need to use e.g. the tray icon to shown them again.

thank you, that has worked pretty well, the only thing is that it show also the events and todo list, although they are empty.

but it's ok anyway, thanks
