problem with variable

Posted by stan pulsar - 2007/01/05 06:17

---

hello ! my first post here !

first of all, all thumbs up for this great piece of software... very handy, though discreet, and highly customizable !

I'm modifying the Shadow4 skin to fit my needs.
In the first place I didn't find the language addon with the translated images, so I re-created them in french. Well, anyway I've implemented a "background color" setting, so this was necessary.

And there is where my problem lies, I've added a "background color" variable to all the windows, it works fine, except for the alarm window where I can't get the variable to show in the advanced settings. (actually for the alarm window, there are no such settings, the button is grayed out, and to create this very first variable doesn't seem to activate it)

Does anyone know what the solution could be?
That's not crucial, but I wanted to get a consistent skin...

Thanks a lot !

-- edit --
sorry, I wanted to reply to the skinning topic, but somehow I created a new thread...

The alarm window doesn't support variables at the moment (or it does but the UI does not). This will be fixed in the next version (hopefully).

OK, thank you very much !
That's absolutely not a problem for me, it was just to know if I was missing something...
