Problem with position setting: Bottom / on Desktop

Posted by huyujamaa - 2011/10/11 13:09

I'm using Rainlendar 2.9 Pro on OSX Lion and the calendar and event list keep popping up on top of other windows even though I have the position set to "on desktop". The "on bottom" setting is grayed out so I can't try with that. I just upgraded from an older version (2.3 or 2.4). This wasn't a problem before.

Can you describe in what kind of situation the event list pops up on top? I went back to Snow Leopard but at least during the brief time I tried Lion I didn't notice this kind of behaviour.

I use multiple spaces. Whenever I switch from one space to another, all the rainlendar windows are on top and I have to focus on another window to hide them.

I tried this again and it seems that the window which gets the focus is moved to top but Rainlendar will be shown over the other windows. It could be just something that the operating system is designed to do but I'll check if there is anything that can be done about this.
