I can't get rainlender to work in Xubuntu. Can anyone help? Thanks.

So, what happens when you try to launch it? Do you get any errors if you try to run Rainlendar from the command line?

I just go to Office - Rainlender and it does nothing. How do I run it from the command line?

Start the terminal and enter: rainlendar2

This is the error message I got, when I did it in the terminal screen.

rainlendar2: error while loading shared libraries: libSDL-1.2.so.0: cannot open shared object file: No such file or directory

You are missing the SDL library (and I seem to be missing it from the dependencies). You should be able to install it with the Synaptic (if that's included in Xubuntu) or with apt-get from the command line. At least in Ubuntu the package is called "libsdl1.2debian".

That did it! Thank you so much for all of your help getting this resolved.

Is there any way to have rainlendar starup automatically on xubuntu?

According to Google xfce has something called xfce4-autostart-editor which should make it possible to define applications that start automatically.
