# Multiple calendar button

Posted by okh - 2007/01/09 06:21

---

I installed Rainlendar on a laptop for someone who works as a personal assistant to a VIP yesterday, with calendars for holidays and special events. She was over herself with joy to have the calendar on the desktop.

For this setup to work perfectly, I think she would need to change between different calendars quite frequently. Typically between calendar for birthdays, calendar for holidays, etc. While it is not hard to do through menus or Ctrl-1/Ctrl-2 etc, ideally I would like to put buttons into the Calendar Window to turn the different calendar on/off. Possibly also a button for the manager window.

Is it possible to make on/off buttons for different calendars in a skin (+scripts)? Ie access menu items through skin? Anyone already tried?

ok

Visually it might look something like this:

I can add the API functions to toggle calendars to the next version. However changing the appearance of the buttons depending whether a calendar is shown or not requires some more work and I'm not sure if I have time to implement support for it at the moment.

Thanks Rainy - mostly curious about this one, whether it could be done by some xml-lua that I didn't figure out yet. I am not even sure it should be on your priority list - keeping things simple is also good.
