## Todo -> Completed -> Crash

Posted by fishy - 2006/12/02 15:46

---

Hi

Whenever I try to set a a Todo (any kind) to completed Rainlendar crashes (well, it freezes and my cpu is going haywire). I'm guessing Rainlendar corrupts my calendar somehow because I doesn't helpt restarting it without replacing my calendar with a backup first.

Any suggestions?

Are you using the latest version? Can you attach the task that causes the problem?

Yes I'm using the latest version (2.01 (b28)). I also use the Swedish language files and the Shadow4-skin with the language-addon if that helps in any way.

I've attached one of my todo's that is causing the problem but I'm experiencing the problem with all todo's.

It seems to create a infinite loop when the next due date is calculated. I'll fix that.

Thanks. Looking forward to the next version/build with the fix...
