Error, when I start Windows XP with Rainlendar

Posted by jokr - 2013/06/18 07:18

Hello,
I am using Windows XP (32 bit) SP 3,
Rainlendar version 2.12 (b131) 32 bit on 19 May 2013
(Translation (German) by Michael Banz)
Licensed for me
Plug-ins:
CalDAV Calendar v1.1 (b131)
Comma Separated Values v1.2 (b131)
Google Calendar v1.11 (b131)
Google Tasks v1.0 (b131).

When I start Rainlendar with Windows I get the attached error message. I can start the program manually.

Sincerely yours
jokr http://www.rainlendar.net/cms/images/fbfiles/images/Rainlendar-afbb3e7ca22ba06d35ca0f167de53528.jpg

It's probably caused by some event that you have in your calendar. The beta versions have the asserts enabled so you see these from time to time. It would be useful if you can attach the event so I can try to check what exactly is the reason for the assert. If you don't know what event is causing the problem you can just click cancel and ignore the issue or go back to the official release version.

Yes, your assumption is probably correct (see Appendix). I can not send the original event, because I changed it. If the error persists, I will send it.
Thanks J.K.
PS: The event is stored in google calendar. Where is the search function of Rainlendar? It gave them earlier in the Administration menu http://www.rainlendar.net/cms/images/fbfiles/images/Rainlendar_3.jpg
