## some bugs/questions in 2.0.1 b29 (windows)

Posted by luckman212 - 2006/12/04 02:58

---

hello Rainy

I have just purchased "pro" version thank you, I used rainlendar 0.22 for a long time and it was one of my favorites. I am glad to see it finally moving ahead again!! :laugh:

now, some questions:

1) switching to next/prev month on calendar using hotkey causes CPU usage spike and takes 1-2 seconds vs. instantaneously with the "old" Rainlendar. This also causes a strange "shimmer" effect on all my text on the screen-- this has been noted by someone else in the forums as well I saw. This is with b28. I have not tested b29 yet. Edit: yes b29 fixes this problem! ;)

2) Is there no way to define a hotkey to switch to "current" month? this was available in previous version. I used this all the time.

3) when switching calendar months, I get a lot of errors like this: "01:00:59: CltemImage:: Draw(): Unable to find the element "" in the rainlendar2.log file?

4) There is no way to change fonts used in Event/To Do windows?? this was also available in "old" version. Edit: I figured this out, you have to dig deep into the XML files. It would be nice if these were changeable via the GUI/advanced options instead but -- as long as I can do it, its ok.

5) I tried unzipping the .r2skin for Shadow4 to get at some of the "hidden" settings, but I could not figure out where it is stored things like spacing in between calendar days, etc. I was able to change all of these in the old version -- on my screen the default spacing is way too "tight" for my taste, I need to spread it out.

that is all for now, thank you!! :)

2) Nope, but I can add that.

3) Just ignore them. I'll remove them when I have time.

5) That is calculated automatically from the size of the <calendar>-element. Just increase the h and w values.

---

2) I downloaded b30-- thanks for adding this!! ;)

3) okay

5) I think I figured it out (see screenshot) but still I cant get the day numbers to align RIGHT. I specified in my XML file but it seems like there is a bug where they always align LEFT. It works if I use CENTER but not RIGHT.

pls. confirm this is a bug or am I doing it wrong?

I attach my files here for you to review.....

perfect! it works...:laugh:  
what is CENTER-RIGHT??  
anyway thanks!!

=====

---

The alignment has vertical and horizontal components (TOP-LEFT, BOTTOM-RIGHT, ...).
