
Link colour

Posted by fermat - 2009/10/20 05:11

I'm using this program from a few days, that's what I was looking for from a while!

I know it is possible to use some simple wiki-based syntax, and to define links in events and tasks.

Can I change, editing the skin, colour and style of links?

Is there a variable or an element that should be defined at this aim?

Thanks

fermat

You can change the link color with the linkcolor attribute in the appearance element (in the xml format skins).
