## Bug with Public/Private Events

Posted by Graves - 2006/12/04 18:34

---

When i add a new Event and disable the "Private" Checkbox or in other words make the event public, save that event, and than open it again for editing, the Private-Checkbox is checked again, although it shouldn't.

I took a look at the ics-file of my calendar and there the event is stored with the correct value (public).

the same thing happens if i create an event initially as private and then change the status to public afterwards. when i edit the event again, the checkbox is checked again.

would be nice to have this fixed, otherwise you can never really say whether an event (same for tasks) is private or public, unless you looked it up in the ics-file ;-)
