Colours in Shadow4 skin
Posted by Spankey - 2008/01/10 10:06

Hi Guys,

I've just started to intergrate my outlook calendar into Rainlendar. All events in which are 'copied' into railendar are displayed as default (blue numbers, white text and no symbols).

To recognise my outlook events in rainendar I've added those event (names)them into the elements file from the xml folder from the skin by copying excisting events and rename them like the events in outlook. This way I've also been able to change the number colours and the symbols.

I can change the text colour aswell, but I don't get it right because of the four numbers (255,100,100,255). What does which number do?
My guess is that 3 of those numners stand for red, green and blue, but which one is what and what does the 4th number do??

Guess is pretty good. Fourth number is the alpha channel - transparency. Think you can skip it. Try the help files. There is a skinning tutorial that is very useful - and not least the Format Reference:

appearance
....
color - The color of the text. The color is defined with four (red, green, blue, alpha) comma separated values from 0 to 255 (alpha value 255 means opaque). This is only used if the element attribute refers to a font.

Where can i find this tuttorial guide??
Right click on Rainlendar > Help.
