Selective transparency?
Posted by Cris - 2008/05/07 15:30

I use Shadow4 with a normal transparency of about 25%, with 100% at mouseover. Is there any way to display the current day with the mouseover transparency level? That way you could see the current day with a quick look and wouldn't need the red ring. Or is transparency handled outside the skin?

Thanks!

Yeah, i'd like it if days which fall outside the current month and have events could be semi transparent (like the way days without events are displayed).

The mouse over transparency always affects the whole window so you would have to edit the skin and change the way the days are drawn (i.e. use a transparent font in normal days and a solid font in today date). This wouldn't work on the days which have events though since currently it's not possible to customize them so that they would be different on today's date and the rest of the days.

Thanks, Rainy. I guessed it might be something like that. Would it be possible to keep the current model but have two layers, with today's date on the front layer at full visibility, and everything else on the back layer at partial transparency? There would be several things you could do on mouseover.
