
Incompatibility with Stardock IconX

Posted by Kvan - 2006/12/05 07:55

Rainlendar2 windows are not visible when Stardock's IconX-software is loaded.

Seen on Windows in release 2.0.1 and also in beta build29. This problem did not exist in the original Rainlendar.

EDIT: Stardock discussion boards indicate that IconX is probably pretty dysfunctional, so I don't think this is worth pursuing beyond putting a note in the readme...

IconX creates a new desktop on top of the default Windows desktop window which hides the calendar if you have "On Desktop" feature enabled. So, using some other window position in Rainlendar should make the windows visible again.
