
network error

Posted by zuckel - 2006/12/05 11:40

i'm having a problem using rainlendar under linux, suse 10.1, kde 3.5.

whenever i try to use a network calendar i get an error message. this is what the log says:

```
16:29:45: Default: Read 0 VEVENTs and 4 VTODOs from file "Default.ics"  
16:29:46: PST: Downloading: http://www.pst.ifi.lmu.de/_dav/lasinger/uni.ics  
16:29:46: PST: Result: (5) 0 Unknown error.
```

any idea where this could come from?

other programs can access the internet of course...

Error 5 is CURLE_COULDNT_RESOLVE_PROXY.

Are you using a proxy? Have you filled in your proxy information correctly?

i don't know of any proxy. and the point is, i've tried it on my colleagues' machines and it works fine there. and we all have pretty much the same setup of hardware, os and configuration.

could it be a timeout issue? because resolving domains takes forever in other progs.

Is the "Proxy server" field in the network calendar's settings empty? I can reproduce the same error if I put a random string into there.

Re:network error

well it should be, because i didn't put anything there.
but i can't check now. we will see tomorrow.

proxy settings are definitely empty.

Then I have no idea what could cause this. I'm using a 3rd party library to access the network and I don't know the details how things are implemented in it. You could try to check if there are any proxy related settings that are set differently in your computer than in your colleagues' computer.

You could also try to "Reset all settings" from the advanced options and reconfigure Rainlendar again to make sure there aren't any old settings e.g. from the previous versions which might cause conflicts.
