Removing/Renaming categories
Posted by emma_bw - 2008/08/20 09:14

I have Rainlendar 2.3, with two calendars displayed.

I've tried to both remove and rename categories from OPTIONS\Advanced\Default categories. In the list there everything looks just fine. But when I edit or make a new event all the removed categories is still there - side by side with the renamed ones that have double instances, both with new and old name.

I thought "oh well, I'll just reset the settings". But when I click that button nothing happens. The categories remain...

What have I done wrong?

EDIT: Problem solved! It was all in the elements.xml-file

I have the same problem, could you tell me how did you solve it?
Where do I find the "elements._xml_ file?

Easy way to remove the categories is to set Options->Advanced->Use categories from the skin to No. If you want to edit the skin's categories you need to make changes to the elements.xml file which is inside the skin archive. You can find more info from the Rainlendar's help file.

Thank you very much, Rainy, and congratulations for the great job you've done with Rainlendar:I lovhe this application!

(i'm sorry, my english in quite terrible, i'm italian...)

How can I remove categories from a skin? I like the color categories and some default categories of the Savanna skin, but I want to remove the rest. I tried editing the elements.xml file but I screwed up and had to restore the default file :/

If what you want is to hide forever some categories from the skin, the only way is removing the lines in the codes. If you already edit the elements.xml file, all you need to remove is lines between (both included)

---

which version are you using?
Reading the full post, there was an option that already exists.
options->advanced->general->"Show categories from the skin"
but if you disable it, I think you will need to create them again.

Also, after removing the categories from elements.xml, you could remove them from the list of options->advanced->general->"default categories".

I often add categories... I never try to remove them...

Yes. Options -> Skins -> Categories... -> Add... -> (insert name) -> Here you can set color and/or icon.
