Rainlendar 2.0 build 27
Posted by Rainy - 2006/11/18 16:27

Build 27 can be downloaded from here:
Windows: Rainlendar-2.0.b27.zip
Linux: Rainlendar-2.0.b27.tar.bz2

This is beta version! It has not been tested.

The list of changes:

- 18 Nov 2006
o Fixed a hang in the alarm calculation function.
o Added padding for all items in the todo list.
o Disabled all exceptions from the DST calculations.
o Replaced the Long Calendar with Vertical Calendar.
o Moving the mouse over the tray doesn't create a crash anymore if the tooltip is not defined.
o List of skin window variables is sorted now.
o Added a tooltip to the tray icon so it can be made always visible now.
o The events should be now always in cronological order in the event list.
o The duration is kept when the start time is changed in the event dialog.
o Added AlarmDefaultSnoozeTime to the advanced options.
o Removed AdjustDaylightSavingTime. The framework does the same automatically so this feature adjusted the time incorrectly.
o Some more changes to the DST calculations.
o Manager preserves the sort order after the items are refreshed.
o NetworkPlugin doesn't create the thread unless the calendar is enabled.
o Items in the Manager didn't have all fields localized. Fixed.
o The timezone in clock can be defined with numbers too (e.g. -10 or +5).
o "Add years to birthdays and anniversaries" option works now also for visual categories.

==========

Excellent build Rainy. I'm glad to see the end of the AdjustDaylightSavingTime setting, I was wondering why it was needed in the first place. All DST problems seem to be fixed. Hopefully no other major problems will come up and you can release it as soon as possible.

Beta 26 works OK, but I'm having problem with this beta 27 release. I get this error..

http://www.rainlendar.net/cms/components/com_joomlaboard/uploaded/images/rainlendar2_beta27.jpg

I've answered this question both ways and never get the desktop calendar display. I get the tray icon, but can not right click and get the selection menu. I've also noticed that Rainlendar is using up all the CPU resources.

I do not have the configuration in the default directory.

I had to fall back to the Beta26.

Can you try restarting with the --debug option and submit the log to Rainy..

Re:Rainlendar 2.0 build 27

Posted by Stormy - 2006/11/19 01:43

Looks like the problem is related to the non-default directory for the config files and using the command line argument... -c,--config="C:\Documents and Settings\All Users\.rainlendar2"

The desktop calendar works fine with the config files back in the default directory C:\Documents and Settings\<yourname>\.rainlendar2

==========

Don't use both the short and long form of the command line argument. Use only -c or --config.

-c "C:\Documents and Settings\All Users\.rainlendar2"
or
--config "C:\Documents and Settings\All Users\.rainlendar2"

==========

The log that --debug generates is HUGE 42,772KB file after about 10-seconds, and then I had to kill the process. Another time I let it run for about 40-seconds and the debug file was over 250,000KB.

...this is the line that's replicated and takes up a huge portion of the log...

or
--config "C:\Documents and Settings\All Users\.rainlendar2"

Good catch, I've made the change. Thanks!! Now to see why the desktop calendar doesn't appear.

Thanks for the build.

Noticed the vertical calendar has the option to more than 2 months (which is cool)

Still waiting for a 3-month hotizaontal calendar - and mainly for a native option for 3-month display of previous-current-next.

And a calendar with a background, naturally.

Tried to look at seemingly "new" skins - all are still in INI form, which means they're not really functional in terms of settings.

15:11:37:  DEBUG: Layer 00F86A00 created for group ""
15:11:37:  ERROR: Unable to create a window with id "Long Calendar". The skin doesn't contain such.
15:11:37:  ERROR: The skin doesn't contain any windows.
```

I simply delete the .ini file and the Prob is done !

Re:Rainlendar 2.0 build 27

Posted by Gideon007 - 2006/11/22 17:58

Now this build gives me problem in showing Google Calendar events in the right time. The time Rainlendar shows is one hour later :(
Anything you want me to check?

==========

Re:Rainlendar 2.0 build 27

Posted by Rainy - 2006/11/23 15:19

Google defines the times with the timezone information included which is not supported by Rainlendar at the moment.

==========

Re:Rainlendar 2.0 build 27

Posted by Gideon007 - 2006/11/23 18:36

I see, setting the general timezone correctly (+1) and then setting the calendars to timezone 0, Rainlendar works correctly.
BUT I *think* it used to work somehow before this build.

--config "C:\Documents and Settings\All Users\.rainlendar2"

The desktop calendar works fine with the config files back in the default directory
C:\Documents and Settings\<yourname>\.rainlendar2

Finally...Success.
1) Removed the program and it's configuration file from the non-default directory.
2) Reinstalled Beta27 using the default directory for the configuration file.
3) Relocated the configuration file and default.ics files to the non-default directory.
4) Added the command line argument --config

Work great!
