## Also have WebDav problem in IIS 5.0

Posted by crumpley - 2006/12/05 21:51

---

I'd like to chime in on this one. I have the same problem with the 403 Forbidden error in Rainlendar 2.0.1 Pro (Unregistered version). My WebDav server works fine with IE and with another WebDAV application called DAVExplorer. Both read and write files fine. Looking for any available information on this problem.

Is registration required for this to work?

Glenn

What kind of authentication method does the webdav server use? Currently Rainlendar works only with basic authentication.

Is registration required for this to work?

No.

My web server is configured for anonymous access. No authentication is required.

Do you get 403 when reading or writing?

Are you able to upload files with curl?

curl.exe -T file.txt http://server/path/to/davhome/

Rainy,  
I presume that the error occurs during writing--it happens when I try to add a new task to the network calendar I created.

I found a copy of curl.exe on my machine in the Yahoo Widgets directory--I presume this is the same program. I tried it with the command you provided and it worked fine. It added the file to my WebDav folder, no problem.

Ok. I'll have to find a IIS that I can use to debug this.

Hmm... I found a Win2k server (with IIS 6) which I could use for testing and set up the webdav support by following these instructions:

[http://www.windowsnetworking.com/articles\\_tutorials/WebDAV-IIS.html](http://www.windowsnetworking.com/articles_tutorials/WebDAV-IIS.html)

(or well, I didn't change the NTFS permissions so the folder was writable by anyone.)

I then configured Rainlendar's Network Shared Calendar plugin to use the server's webdav folder and after few (expected) 404 errors the ics file appeared to the folder and I was able to use it without any problems.

So, I have no idea what could cause the 403 error. Perhaps the webdav works different way in IIS 5?
