Problem in adding a new calendar in Windows 7
Posted by karhyv - 2010/01/27 03:43
_____

I have a curious problem in Windows 7. I cannot add a new calendar because the windows where I am supposed to select the ics file is way too small, about 1/4 of the same window in XP.
 http://www.rainlendar.net/cms/images/fbfiles/images/Sieppaa.PNG
I tried to edit rainlendar2.ini directly, adding the calendar entry form XP:

Filename=C:\\Program Files\\GCALDaemon\\google.ics
Monitor=1
But this will not work, either.   :(

Weird bug. Is this on a netbook or normal computer? What version of Rainlendar are you using? Does the same happen with the latest beta build?

_____

It is a netbook, Asus EeePC T91MT. Rainlendar version is 2.6 (b82)

The beta version produces the same peculiar small window, unfortunately.

What about manually adding the calendar? Can it be done at all?

_____

I figured out what was missing from rainlandar2.ini. Further down the file, there is a section where calendars are listed. This must be updated, like so:

Calendars]
Count=2

Name=Google-kalenteri
Plugin=iCalendar Format
Enabled=1
ReadOnly=0
SuppressAlarms=0
VisualCategory=

Now I have a working calendar! :cheer: The window problem remains, however.
