## Problem Danish

Posted by hkiel - 2006/12/07 21:42

---

Hello. I'm a new user of this wonderfull calendar, but the months and weekdays are not shown in danish, but in english. All other things are displayed in danish. What can i do about this??

Henrik

Henrik

From the Language download page:

NOTE If the skin uses bitmaps to draw the months and days, changing the language of the user interface does not affect the calendar on the desktop. To fully localize the application you can download the Shadow4.r2skin-addon which contains localized versions of the bitmaps for the default skin.

Did you install the skin addon? Does Options->Addons->SkinLanguage list all the different languages?

Do you ever read a FAQ or a Help-file, before posting your questions in a forum? :angry:

- From the FAQ:

How can I install skins or languages?

Written by Kimmo Pekkola

There are two kinds of skins for Rainlendar: The old skins which are usually distributed as a zip or rar archive and the new skins which have .r2skin extension.

To install old skins you need to uncompress the skin into the Rainlendar's skins-folder. Make sure that no extra folders are created when you unzip the archive. There must be only one subfolder under the skins-folder where the skin's ini-file(s) are located. After you refresh the calendar the skin should appear in the skin list. If that doesn't happen check the Rainlendar's log file for possible errors.

To install new skins (.r2skin) you can just drag and drop the file over one of the Rainlendar's windows and it will be installed automatically. In Windows you can install the skin also just by double clicking it.

---

The languages (.r2lang) can be installed the same way as the new skins (i.e. by double clicking or dropping).

- From the Help-file:

Skins  
Windows: Just double click the skin file (.r2skin) and it gets installed automatically. Or drop the file over one of the Rainlendar's windows.

Uninstall: You can uninstall the skin manually by deleting it from Rainlendar's skins-folder. Do not delete a skin that you are currently using. The old Rainlendar skins can be uninstalled the same way except that instead of deleting the file you need to delete the folder where the skin's files are.

Note that the skin is not visible in the options dialog until you refresh Rainlendar.

No need to, it must work. Again, are you sure you installed the skin?

- check: Options > Skins > Available skins (section)

There must be a skin named 'Shadow4'

- check: Options > General > Language

Is the wanted language (Danish I presume) selected?

- check: Options > Advanced > SkinLanguage

Click on 'Default' and open the dropdownlist

Is it possible to select 'Danish' here?

May be that's the problem. In Options > Advanced > SkinLanguage is it only possible to choose Default and English

Then the only conclusion can be, that the skin isn't installed properly. So, download the skin file again, remove the old skin from the skin folder if present and install the skin again.

Please read all the installation instructions again carefully before installing.

Done, and nothing happens. I am so sorry, but have spend yours and my time on this. So, again, i'm going to live with

---

the english version.

OK, now i found the solution. The shadow4 skin does not support multilanguages. I found glossy blue v2.1. This skin support multilanguages, and now everything works.

hkiel wrote:

The shadow4 skin does not support multilanguages.

I'm sorry for you, but this is absolutely NOT true.

I asked you again, did you download/installed the right skin file? The one with all the foreign languages and not only the English language? It's at the bottom of the language page of the website (follow the link here to download directly):

NOTE If the skin uses bitmaps to draw the months and days, changing the language of the user interface does not affect the calendar on the desktop. To fully localize the application you can download the Shadow4.r2skin-addon which contains localized versions of the bitmaps for the default skin.

These are the supported languages in ths skin file:

English, Albanian, Astur, Belarus, Brezhoneg, Bulgarian, Catalan, Croatian, Czech, Danish, Dutch, Estonian, Euskera, Finnish, French, German, Greek, Hebrew, Italian, Japanese, Korean Hangul, Korean, Hanja, Latvian, Lithuanian, Magyar, Norwegian, Polish, Portuguese, Portuguese (Brazilian), Romana, Russian, Serbian, Simplified Chinese, Slovak, Slovenian, Spanish, Swedish, Traditional Chinese, Turkish, Ukrainian.

OK, let's give it another chance. Resume: Installed Rainlendar-Lite 2.0.1. Downloaded and installed danish languagefile. Until here it works in danish, but not on the desktop. Downloaded the shadow4 addonfile. This is a zip.file and contents a directory with "images" and one with "xml". The zipfile cannot be installed by itself, therefore i renamed it from Shadow4.zip to Shadow4.r2skin. Then it can be installed and it says correct installed, please refresh and see the results. The results are, that now the shadow4 not enymore are shown as installed skins. What shall i do about that. If the "images" and "xml" shall be installed manuel from the zipfile, how to do that. Hope that you can see my problem. I have realy worked very hard to make this work, but untill now without result.

Henrik

The zipfile cannot be installed by itself, therefore i renamed it from Shadow4.zip to Shadow4.r2skin.

I think you renamed it the other way round: the original name is 'Shadow4.r2skin-addon' and you renamed it to "Shadow4.zip". Is this right? If so:

Could you remember I asked you in one of my first replies:

"Do you ever read a FAQ or a Help-file, before posting your questions in a forum?"

Where did you read that you have to rename the skin-file into a zip-file? After installation of Rainlendar there are 3 file-extensions '.r2skin-addon', '.r2skin' and '.r2lang' registered to Rainlendar, so if you execute such a file (by double clicking in Windows Explorer or draging the file over a Rainlendar window) with one of these file-extensions the installation is started automatically.

So I suggest to try it again with the original (not renamed) skin-file: Shadow4.r2skin-addon.

I've been wondering how on earth this could be so difficult until I tried to download the skin addon with IE6. To my surprise it changed the file extension automatically to ".zip". And the same happens with the ".r2skin"-extension too. I wonder if IE7 has this nice "feature" too...

As you see folks, i'm not so stupid:P It is NOT possible to download the nessesary add-on file so it can be used correctly! I am now using an old version of your calendar, and there are no problems translating to my language. I will be glad to here from you if you find "the wise stones". Sorry about my English, but i am doing my very best;)

Hello again. Is it possible to mail the correct skin add on to me instead of downloading from the site?

CONGRATULATION! This should be the lucky end of this story. According to Your reply with zip and so on I just downloaded the file with save as "Shadow4.r2skin-addon, installed it and WUPTI, everything is working at the first time. We have now been using more than a week and it now is working in less than 5 minutes. I will thank You for a really good program, was a little difficult to handle, but now it is very good. Thank You (everybody) for replays and I hope, that you allso has been learning a little. Thank You very mush.

:laugh: :) :laugh:

I'm glad this 'drama' is solved now. And yes, I learned something too from this: To stay much further away from Internet Explorer then I ever did...

Have fun with the Danish Rainlendar, hkiel !
