## Removing tray icon crashes Rainlendar

Posted by schendi - 2006/10/30 19:38

---

The bug report refers to the Shadow4-Skin and the Windows version of Rainlendar.

Removing the tray icon in Options->Skins, i.e. marking it in the "Active skins" window and pressing the "<--" button caused Rainlendar to crash after I confirmed with "OK". This is reproducible.

After a restart of Rainlendar I got the following message:

"Rainlendar was not able to refresh the settings correctly. Do you want to reset all settings and try again? (Select "No" to open Rainlendar with old settings) "

So far I always chose "No" because I did not want to screw up my settings. Rainlendar starts as usual but then I can see kind of a blank tray icon (just free space) which I suppose is caused by Rainlendar.

When I tried to "fix" the situation I had to add the tray icon twice (press the button twice) to make it appear in the "Active skins" window.

:S
