
Sync with Android-Phones?

Posted by yoodilo - 2010/06/02 11:06

hey there,

is there any easy way to synchronize events and todos between rainlendar and an android-running phone like the htc desire? :)

thanks!

I would assume that you can sync at least the event through Google calendar. Not sure how to sync the tasks though (does Android support Remember the Milk)?

Is there any possibility? I hate the aspect that google knows every of my events :(is it possible to make the calendar on google at least private / password protected!?

edit: I need rainlendar pro to do it, right?! are the events directly synchronized with rainlendar, so when adding an event to google calendar, rainlendar updates the calendar on my computer and the other way round!?

As far as I know the Google calendars are private by default but the data isn't encrypted so Google will have access to it. It's not possible to get any notification when the events are edited in the Google's website so there is a small delay before the changes are updated to Rainlendar (you can adjust that with the Poll Frequency setting). And yes, you need the Rainlendar Pro version for the Google calendar support.

Okay thanks so far. Two more questions I have:

1. How to upgrade from my currently running rainlendar free (I'm using beta versions) to the pro version? Are there also beta versions for the pro-version?
 2. Is it possible to exclude certain categories when synchronizing? I blend out done events by adding the category "done" to it and thus I don't want them to be uploaded. Or when I set an event to "done" in rainlendar, it should be deleted (if it was uploaded to google before).

1. You can just install the Pro version over your current installation (or create a backup, uninstall the Lite and install the

Pro). The beta versions are always for the Pro.

2. Rainlendar doesn't rely on any local data with the network calendars so all information must be uploaded to the server. If you want to ignore some events you either need to delete them manually or move to some other calendar.

Hm, okay, so does google calendar support categories?

Perhaps there is a way to hide the events with a certain category in the calendar on the android phone, than I could use the current way.

Do you think this script would still work to add the category "ausblenden" to events by clicking a little button:

http://www.rainlendar.net/cms/index.php?option=com_kunena&Itemid=42&func=view&catid=6&id=10515&limit=6&limitstart=12
?

You can still hide the appointments with certain categories in Rainlendar but I doubt you can do that in the device or in the Google calendar webpage.

Yes, the script should work for the Google calendar's events too.

Okay thanks, I purchased the pro version :)

Re:Sync with Android-Phones?

I purchased Rainlender Pro 2 with the view that I would be able to enter events and tasks in Rainlender and that they would be synced to my Google calendar to read on my laptop or Android phone, or vice-versa. Also, I hoped that all of my events and tasks previously entered into Rainlender Lite would be synced to my Google calendar. So far, it seems that I can go from my Google calendar to Rainlender but not from Rainlender to my Google calendar. Is this correct, or is there a way to sync in either direction?

If you go to manager you can see what calendar the events are stored in. You can select the ones that are stored locally and move them to your google calendar.

See Rainy's response here
