## Debuging Rainlander - XML comments and skin addons

Posted by Nux - 2010/06/25 02:42

---

Hi.

I'm customizing Statica and wanted to debug it but I get some errors weird errors and warnings.

First things is XML comments () seem to generate a warning: Unknown item "comment". So what would be a correct way of adding comments in Rainlander's XML files?

Also I wanted to unpack all skins but I get a lot of errors with Shadow4 addon and still an error even if it is compressed: ERROR: File/folder "\Rainlendar2\skins\Shadow4-Widgets.r2skin-addon" is not a Rainlendar skin. Is this something to worry about?

I wasn't able to reproduce the problem with the comments. Do you get the warning even if the comment block doesn't contain anything?

The skin addon is not a standalone skin. It needs to be integrated into the Shadow4 skin (you can just copy the files to the Shadow4 folder).

Warnings seem to come from my weather file (attached). All six comments (including an empty one) seem to generate a warning. Not really a problem, just not helpful if comments are in fact allowed. <http://www.rainlendar.net/cms/images/fbfiles/files/weather.xml>

I found what is causing the warning. I'll remove it from the next build.
