
Toggle all windows but given

Posted by Nux - 2010/07/08 19:10

Hi. I'm trying to make a script that toggles all windows but the I give as a first param.

```
function Statica_ToggleWindowsButGiven(strWindow)
  local visible = false
  listWindows = Rainlendar_GetWindows()
  for key, win in pairs(listWindows) do
    if strWindow~=win and Rainlendar_IsWindowVisible(win) then
      visible = true
      break
    end
  end
  --visible = false

--]
if visible then
  for key, win in pairs(listWindows) do
    if strWindow~=win then
      Rainlendar_HideWindow(win)
    end
  end
else
  for key, win in pairs(listWindows) do
    if strWindow~=win then
      Rainlendar_ShowWindow(win)
    end
  end
end
--]
end
```

I think the problem might be because `Rainlendar_GetWindows()` doesn't work as I would expect (don't return names of windows). Is there some reference for functions like that? Is there a function that would output something to the debug log?

=====

The skin name is prefixed with the name of the window (i.e. "skin::window") so you need to include it also in the parameter. You can find the reference documentation for all the functions from Rainlendar's help file. You can write log messages with `Rainlendar_Log()`.

Cool. It works.

If anyone want to use the code - take it it's for free :-). Note that "Clock and Management" is my window which I want visible all the time (it has various toggle buttons for all other windows).

```
--
-- Toggle all windows but Statica management
--
function Hotkey_Toggle_Windows_But_Management_Clock()
  Statica_ToggleWindowsButGiven ("Statica", "Clock and Management")
```

```

-- if closed - show it
if not Rainlendar_IsWindowVisible("Clock and Management") then
  Rainlendar_ShowWindow("Clock and Management")
end
end

--
-- Toggle all windows but given as the first param
--
function Statica_ToggleWindowsButGiven(strSkin, strWindow)
  local visible = false
  local strWindowPath = strSkin.."::"..strWindow
  listWindows = Rainlendar_GetWindows()
  for key, win in pairs(listWindows) do
    if strWindowPath~=win and Rainlendar_IsWindowVisible(win) then
      visible = true
      break
    end
  end
  end
  --visible = false

  if visible then
    for key, win in pairs(listWindows) do
      if strWindowPath~=win then
        Rainlendar_HideWindow(win)
      end
    end
  else
    for key, win in pairs(listWindows) do
      if strWindowPath~=win then
        Rainlendar_ShowWindow(win)
      end
    end
  end
end
end

```

Hello coders

I am new to Rainlendar but would like to use the code you've given. Into where in Rainlendar do I put the code? And how to I activate it (i.e. call the function)? I want to assign it to a click on the Rainlendar icon on my iconbar.

Thanks for your time.

Scripts are in lua files which can be found in e.g. skins. Just be careful when you change something there because your Rainlendar might stop working.

OK; thanks. But I've given up on Rainlendar.
