## Does QuickAdd support color tags

Posted by astrix - 2010/08/04 19:43

---

hi,

can someone please help me whether quickadd allows for color tags if so whats the syntax?? i did a search for quickadd color but couldn't find a definitive answer. eg. i create task event etc and parse red or etc no effect...???

secondly, i noticed on the wiki one can create quickadd templates?? anyone got any sample templates that they can post with examples for customization....and where is the quickadd template stored.

thanks in advance.

regards.

Yes, the color categories should work just fine (e.g. "Test #") if you have the latest Rainlendar version and you are using the Shadow4 skin.

The template for quick add is same as any other event or task template. You just need to name it as "QuickAdd".
