## Some bugs i found..

Posted by daman - 2006/12/11 09:43

---

been using rainlendar 0.22.1 .. updated to 2.0.1 pro.. after installing a number of things went wrong.. firstly my laptop changed its font type from cleartype to standard (didnt change anything in display options, just the display itself) .. 2ndly, the refreshing after each and every single change u do, is really annoying and eats up a lot of system resource (esp. computers with no dedicated gfx!) .. 3rdly, the event bubble looks weird with the absolute text wrapping! it looked cool wen it had space to its left and right.. and ohh.. most importantly, the hover effect .. like opacity coming back wen u over over a transparent calender.. its just too slow! and also when changing between months, it's extremely slow relative to the previous version..

as much as ive been waiting for the new rainlander release.. its jus not happening for me.. for me, m sticking with 0.22.1.. it's the best so far!!! really wish and hope to see improvements in the next build.. cant wait!

The slowdown and other problems caused by the cleartype has been fixed in build 29 (available from the beta forum).
