
Installation with Fedora Core 6

Posted by mrt0xicity - 2006/12/12 02:44

I have been trying to install Rainlendar2 onto my laptop, running Fedora Core 6. After unzipping and going into the rainlendar2 directory, as instructed, I type ./rainlendar2 into the terminal. And then nothing happens. Does it simply not work with Fedora? Or is there something I can do?

No error messages? Does the process start at all? Do you have all the dependent libraries (i.e. what does "ldd rainlendar2" show)?
