
Rainlendar 2.8 BETA build 96

Posted by Rainy - 2010/10/10 04:40

Build 96 can be downloaded from here:

Windows (32-bit): Rainlendar-2.8.b96-32bit.zip
Windows (64-bit): Rainlendar-2.8.b96-64bit.zip
Linux TAR (32-bit): Rainlendar-2.8.b96-i386.tar.bz2
Linux DEB (32-bit): rainlendar2-pro_2.8.b96-1_i386.deb
Linux TAR (64-bit): Rainlendar-2.8.b96-amd64.tar.bz2
Linux DEB (64-bit): rainlendar2-pro_2.8.b96-1_amd64.deb
Mac OS X (Intel): Rainlendar-2.8.b96.dmg

MD5SUMS-b96

This is beta version! It has not been tested.

Changes:

- o If all windows and the tray icon were hidden the warning dialog wasn't shown in the startup. Fixed.
- o The event's alarm is now set no matter which method is used in Google calendar (previously only 'alert' methods were supported).
- o Network shared calendar used the same authentication method as the proxy which could prevent the connection. Proxy uses now always basic auth.
- o The debug log contains now also the debug output from curl.
- o The tray icon is not removed anymore on Linux when it is being updated.
- o Added "todayevents" item for the xml skin format which can define the appearance of the events which are on the current day.
- o The start and end times for multiday events are shown from 0:00 to 23:59 on the intermediate days.
- o Url buttons didn't work on Mac build. Fixed.
- o Added a variable for the all day area height in the schedule views.
- o It's now possible to delete all the following recurring events in the delete confirmation dialog.

The latest stable version of Rainlendar was not visible anymore after the upgrade of Ubuntu to 10.10.

It was solved by using this beta version.

Thanks. ;)

Just updated to Ubuntu 10.10 and was about to file a bug report, when I saw the notice: beta works like a charm, many Thanks!

Rainlendar is probably the only software I never regretted to have bought! Thumbs up!

Windows 7 RUS

I have EXACTLY the same issue, both vertical and horizontal bar have this :(
It was fine in previous build.

Windows 7 x64

I do not see an RSS widget after this beta installation.
Rest of functions work just fine.

I installed the beta version because I'm on Maverick
but I can not import the ics file
when I open the manager, I did not import or export
I tried reinstalling the version 2.7 but nothing changes.

an idea ?

thanks

Hi people!

I've installed this BETA on Kubuntu 10.10 and I'm facing a problem. I can't use the "On the desktop" option. When I use it, Rainlendar windows stays above the rest of the windows and doesn't disappear. When I use the "On the bottom" option, everything is OK, but swapping between windows is messed by the Rainlendar's windows (I have opened two windows, but I must swap between four). Is there any possibility to fix this?

Thank you

Tomas

Yes, the On Desktop feature kinda sucks on Linux but it's the only way I know how to implement it. If you can point me to a application (other than Conky) which has this kind of feature I can see if it could be implemented the same way in Rainlendar too.

There is an option in Rainlendar's advanced options called "Use window names". If you have it enabled try disabling it as it might hide the Rainlendar's windows from the window manager (this probably depends on the WM though).
