## Font color on links (especially on RSS-feeds)

Posted by Jorse - 2010/10/15 19:50

---

I've been using Rainlendar for a quite a while but couple of days ago one of my hard drives died and rainlendar with it. So I have to customize the Shadow4-skin all over again.

Everything else went fine but I'm not able to find the right place to change the color on text-links. This shows in RSS and weather especially (the original color is violet, I would like to change it to simple white). In the past I did finally (after many many hours) find the solution but now, can't find it anywhere.

Could someone please help? Thanks.

You can define the link color in the appearance elements. So, open the rss.xml and change the appearance to something like this:

The normal text item doesn't seem to support the linkcolor attribute so I'll have to add it in the next build.

edit: nothing, I found the solution. Had to change both item AND header. Didn't remember that.
