## Digital clock: Date format

Posted by martkrui - 2006/12/19 02:04

---

I've configured Rainlendar pretty much the way I like it but I could do with a small extra features on the Digital clock :

Being able to show a '-' or '/' or '\' for date separation (eg 15:01 19/12)

And as I use multiple clocks to form a "world clock" I would like to add a name to a clock  
(eg Amsterdam 15:01 19/12 ) (Perhaps entered between brackets or quotes not to confuse the date parsing)

Kind regards,

Martijn

Any remarks about my request ?

If you mean the digiclock window in Shadow4, it's not possible to show text with it since it uses images but I can probably add the forward slash to it.

Yes, I'm talking about the digiclock window in shadow4.

I've got three of them now on different timezones and I'm using format : %H:%M %d %m . Adding a forward slash would be nice to better format the date part.

I didn't realize that the texts are pictures so using a std font to add text would look odd.

Anyway, I love rainlendar. I've been using the old version and recently installed the paid version. Using it as a world clock is just an extra.  
Keep up the good work.
