
FTP not working

Posted by s33k - 2006/12/21 21:24

Hi,

first of all I'd like to thank you for creating this amazing piece of software. you definitely made my day :)

but there is a problem linked to the included ftp support (maybe it's just a misconfiguration from my side, but I dont think so :D)

so here's the bug(?):

from the ftp server log I've seen that rainlendar2 tries upload a .tmp file to the ftp dir and then rename it via RNFR blabla.ics.tmp & RNT0 blabla.ics. Since there is still the blabla.ics on the server this will result in "550 file exists". Maybe it's just me, but this shouldn't work with any ftp configuration.

there are two ways to fix this:

1st: del blabla.ics and upload the edited blabla.ics file at once.

2nd: before doing the RNT0 blabla.ics delete the old blabla.ics

Please include this in the next beta!

My configuration:

Rainlendar2 2.0.1 b30

Filezilla Server 0.9.20 beta.

all windows setup, the ftp user has every right on that dir/files.

Well, at least proftpd worked fine when I tried it the last time. I'm not sure what the standard says so it might be that it works against it.

Anyway, I'm aware of the problem with the rename and I tried to change it so that the original file would be deleted before the .tmp is renamed but there were some problems with delivering the commands to the ftp server. I'll get a newer version of the library I'm using for the ftp transfer to see if that fixes the problem.
