## network shared calendar local cache

Posted by prefect - 2006/12/23 15:26

---

Has any work around or solution to this been found?

Having the network shared calendar cached locally is definately needed. Adding the events to two seperate calendars gets messy.

( This was supposed to be a reply to [http://www.rainlendar.net/cms/index.php?option=com\\_joomlboard&Itemid=27&func=view&id=720&catid=8](http://www.rainlendar.net/cms/index.php?option=com_joomlboard&Itemid=27&func=view&id=720&catid=8) but I screwed up :P )

Possibility to cache the files locally was implemented in build 30.

That new feature included in build 30 is definitely nice. I'm using Google Agenda as a network agenda.

When I add something in "TO DO", Rainlendar tries to upload the change. The result is always a network misstake.

It would be nice to have the option to enable/disable the upload try.

I noticed similar problem myself too. In my case the online calendar I had subscribed was changed and now Rainlendar tries to upload the old events back every time I start it. I'll try to do something about this.

It might be a little bit OT here, but I won't open a new thread for this:

Always while I resume my XPSP2 from Standby, I got instantly an error message, that there is no connection to my WEBdav share.

Confirming the dialog and refreshing rainlendar after a few seconds manually, all work fine.

I think the windows network comes up with a delay after resuming (the efect is worse on my WLAN Client).

So I suggest, if rainlendar delays synchronizing itself a bit aswell, the Error message could be suppressed.

(Correct me if I'm wrong.)

Rainlendar should automatically retry to download the events if the network is down. I think the poll delay is one minute so you'll have to wait a bit more than few seconds.

squalo: Why don't you put "Suppress Error" on "True"?
