
Weather Module

Posted by jeffgraper - 2011/03/03 11:19

I wanted to have some separate xml files for different weather backgrounds in the weather module. I added the background names to the widget-elements file and then created new weather.xml files with corresponding names (like auraweather.xml). When I added the files to the list in widget-addon.xml, everything disappears.

Any clue to what I'm doing wrong?

Thanks

Do you have change the Window's ID, Image's ID, ...etc?

Rainlendar's help-file wrote:

"id - This is the identifier for the item. You can use any string but it should be unique (i.e. not used by any other item)"

Thanks. Window ID was the ticket !!

Now I just have to get them to update properly.

OK, just added the ID's to the weather_location variable in widget-addon.xml and everything works fine now.
