
rainlendar 2 is still beta imo

Posted by OriginalGnome - 2006/12/29 04:09

What does it mean when all downloadable skins for r2 lag r2 like no 2morrow (10sec delayed reaction), resets your font from clear type to standard and makes the text in unrelated windows ripple as if you have a virus.

Something is seriously wrong here and its either r2 and the skinning language that skimmers must utilise or inept skimmers. I'm leaning more towards the former.

note: the default skin that r2 comes with isn't plagued by these problems - unfortunately that skin is lame imo.

Ah well, back to the old ver for stability. Or mayb i'll try those Yahoo widgets...

The problem with Cleartype is a known issue and it has been fixed in the newer builds (available in the beta forum).
