## Button alarm disabled when calendar=Google

Posted by JSimR - 2011/04/23 05:03

---

When I select Calendar=Google the button alarm is disabled.

The button is disabled if the calendar doesn't support custom alarm sounds for events.

:blink: But the alarm will sound in my PC through Rainlendar. Google hasn't sounds. Google is the calendar server, the sounds are part of client program!

In my cell phone the Google alarms has its own sounds, this sounds are configurable in the client, never in the server. All Google clients work of this form.

Until now, it was permitted and it worked properly. Why now not?

What sound uses Rainlendar for this events? Nothing?

The button sets a custom audio for that individual event only which means that the sound file or a reference to it must be stored to the event. This is not done for the Google events which is the reason the button is disabled. If an event doesn't define a custom sound the normal alarm sound is played.
