
Natural language parsing for new events and tasks

Posted by spambot06 - 2011/08/28 05:13

Are there any scripts that change the Rainlendar events/tasks entry form to carry out natural language parsing for Ggal events and RTM tasks e.g. '10am to 11am tuesday Business Meeting' turns into a 1 hour meeting next tuesday entitled 'Business Meeting'? Since both of these websites support that kind of parsing inherently I thought that placing it within the summary would work but apparently not.

Thanks for your help.

I think you're talking about the QuickAdd window, in Shadow4 skin.
(It currently works only for English language)
