## v2.9b111 doesn't remember alarm parameter

Posted by rhino - 2011/09/06 21:24

---

Windows 7 enterprise, latest rainlendar (non beta).

Create a new event template and set the alarm as 30 minutes. Save it and set it as default. Close and restart rainlendar.

Create a new event and now the 'minutes' is missing.

I have a video screenshot of the process which i am trying to attach.

Attachment is 2000Kb wmv file and was rejected. If you need it please give me an alternate means to send.

Thanks.

I tried this but I wasn't able to reproduce the problem. Does the time get stored to the settings file correctly? You can find the alarm from the file by searching for the line "".

=====

## Re:v2.9b111 doesn't remember alarm parameter

---

The problem will be happen when close rainlendar and restart.

And the calendar setting always be "Default".

---

I tried that but I can't reproduce either of the problems. Are the values stored to the settings file?

=====

## Re:v2.9b111 doesn't remember alarm parameter

Posted by anoob - 2011/09/11 12:13

---

Are the values stored to the settings file? Yes, but do not know whether there are missing some values?

The stored is :

Name=30 min

Summary=

Location=

Url=

Description=

Private=1

Busy=1

Calendars=

Categories=  
AllDayEvent=1  
StartDefined=1  
DueDefined=0  
ShowInCalendar=1  
Priority=0  
Status=0  
Progress=0  
Repeat=0  
RepeatCount=1  
RepeatType=2  
WeeklyDays=33  
MonthlySelection=0  
RepeatEnd=0  
RepeatTimes=1  
AlarmCount=1

AlarmTime=30  
AlarmChoise=0  
AlarmFile=

And you can see the "Calendars=" is empty, so the setting of calendar will always be "Default".

OS : Windows Xp Pro SP3  
Language : Traditional Chinese

Additional:

About "missing alarm parameter", i tested the previous version and found that this problem had existed from 2.9b104 (2.8.1b103 working properly), that started to support Multiple Alarm.

About 'the calendar will always be "Default" ', should wrote as 'the calendar will always be "Last Selected" ', and i found that if i enable the "allow multiple calendars", it working correctly.

When you create the template only the values which you change get saved to it. So if you want to add the calendar to the template you at need to open the calendar combobox and select the calendar. The same goes with all the other fields too.

rhino, those are not the template settings. You need to check under the section what gets saved to the template.
