## unhandled win32 exception

Posted by alancogg - 2011/09/11 23:20

---

I have been using Rainlendar for a long time. Yesterday it crashed with a "unhandled win32 exception" error. I reloaded it and it started just fine. Then after 4-5 seconds, it crashes with the same error. I downloaded the latest version and installed it, re-booted and again it crashed after a couple of seconds. I ran AV/Anti-spyware from several sources and system is clean. Ran Memtest+ overnight and there were no problems with the 4 gigs of Crucial memory. I am running Windows Vista Home Premium SP2 32-bit.

Any suggestions? Could my calendar file be corrupt?

Try to get a crash dump and send it to me (use the Rainlendar's support address and refer to this post in the email). I can try to check from it what causes the crash.
