
How to move current task to subtask?

Posted by grofaty - 2011/12/18 03:55

Rainlendar 2.9 on Windows xp,

I have created several tasks, but now I have found out that I should group them. So I have created one new "parent" tasks and now I would like to move all of my 50+ tasks into newly created "parent" task. So how to move current tasks to become subtasks of some other task?

Thanks

I think the fastest way is drag the previous-tasks directly, one by one, into the new parent-task.

And if you want to drag tasks, you only need to set the sort-order as "Custom".
