
localization for linux

Posted by tomo - 2007/01/07 14:50

hello, i'm using Rainlendar Version 2.0.1 (b28) on Fedora Core 6, and tryin to insatl Japanese localization which is downloaded from official site.

When i drag "Japanese.r2lang" file into calendar, it shows "The language was installed succesfully! Please refresh (or restart) Rainlendar to see the changes." , though it doesn not show Japanese option on the menu.

i also tried to unzip the "Japanese.r2lang" file and store the ja_JP into raidar's locate folder, though it keeps the same result.

please help me out. thanx in advance

You need to have Japanese language support installed into the OS. At least in Ubuntu this can be done from System->Administration->Language Support. I have never used Fedora Core so I don't know how it is done in there.

thanks for your advice, but i'm currently using japanese environment(i choose japanese option when i install fedora)

i've attached a screenshot so that someone might gonna be able to figure this prob out.

plz let me know for any ideas.
thanks

Fedora probably does some things differently than Debian/Ubuntu. If I have time in the future I can try to get a Fedora Core image for VMWare and try to debug this.

... and where do those Finnish language files should put on Ubuntu Gutsy Gibbon? If I try to drag and drop them like the main page says, I only get a message: You don't have privileges to do that.

Just gimme the words, which I should put on console!

Try this:

```
sudo rainlendar2 -i Finnish.r2lang
```

Thank you that works and the rainlendar seems to work perfectly with KOrganizer, on Gnome desktop.
