
rainlendar not working with newer curl on linux

Posted by ichinoeda - 2012/01/25 13:30

With curl 7.24.0-1 I get the following error:

```
/opt/rainlendar2/rainlendar2: /usr/lib/libcurl.so.4: version `CURL_OPENSSL_3' not found (required by /opt/rainlendar2/rainlendar2)
```

So I had to downgrade to curl 7.23.1-2. I don't know if the versioning and the error is Arch Linux specific. But would be nice if rainlendar worked with newer curl as well. :)

Following suit. Same issue here. Arch here too.

Same.
Arch linux user.
Updated curl to 7.24.0-2
Using rainlendar 2.10.b114-1, but also tried on 2.9-1

```
rainlendar: /usr/lib/libcurl.so.4: version `CURL_OPENSSL_3' not found (required by rainlendar)
```

Same here. Also running on Arch Linux.

I've reported this issue as a bug in this thread.

For those who are desperate. Here's a fix:

<http://pastebin.com/hk43VQBQ>

It worked for me.

With the new Rainlendar2 beta from here:
http://www.rainlendar.net/cms/index.php?option=com_kunena&Itemid=42&func=view&catid=7&id=16790
and the openssl098 package from here:
<https://aur.archlinux.org/packages.php?ID=40574>
everything works fine.

Excellent news!
I can attest that the arch's AUR has the latest beta with the correct dependencies and that it works.

Anybody knows to fix the problem with latest rainlendar beta and Ubuntu 12 not able to install at all, even with all dependencies installed like tofrodos.

The latest Ubuntu seems to require at least sdl, libjpeg and libssl to be installed so you could try this:

```
sudo apt-get install libsdl1.2debian libssl0.9.8 libjpeg62
```
