## Notification bug

Posted by oblivion - 2012/02/01 01:51

---

Running Version 2.9 (b111) 32 bit, Build on Aug 12 2011, under Win7 Starter on my netbook. Using the default (shadow4) skin.

Netbooks being what they are (not enough screen height!) I have my taskbar at the left edge instead of the bottom, and set to autohide.

Rainlendar event notifications from the system tray icon get truncated by the left edge of the screen, so only the right side of the popup balloon is visible.

Not a big deal, I guess...

True. I probably could move the tooltip inside the screen in this case even though it would point to an incorrect icon in the tray but at least you would be able to see all the text.

Probably not a big deal, as I said. Might be more important if I didn't have the events list onscreen, I guess... but I don't suppose it matters if it points to the wrong place, nobody's going to think "Hey, the volume control knows my schedule!"

...I hope nobody's going to think the volume control knows their schedule... ;)
