
Digiclock Addon forgets positions

Posted by chaos - 2012/02/08 03:27

I defined two clocks, one for the hours and the other for date. After positioning them on the desktop, I added "click though=1" and "WindowPositionY=0" to the ini file. After some time (usually a few weeks or so), Rainlendar seems to forget the positions of the two clocks show them overlapped on the upper right corner.

Does this affect just the clocks or other windows too? Try adding "SaveWindowPosition=0" to the ini file also (under the same sections where the window's WindowPositionY is too). It should make Rainlendar not to update the positions for the window anymore.
