## Rainlendar + File on Webserver

Posted by brandy - 2012/03/23 07:08

Hello!

I have a webserver for my websites, statistictools, project management and so on.

Further I'm using Rainlendar on my Notebook. Now I have a smartphone, and I want to see the same events as on my notebook. It would be enough if I have the latest calenderfile on my server. Then I can import it in my project management and it would be enough.

Is it possible to save the calenderfile (icalender) automaticly on my webserver? Maybe you have another better solution!

Thanks for your help!

PS: I don't want to use Google, Dropbox and the other friends... It would be too easy :laugh:

The "Network Shared Calendar" in Rainlendar Pro is able to read and write the calendar file on a web server. Just define the url to the ics file and give your credentials and Rainlendar will read the file from the server. Note that you need to enable the WebDAV extension in the web server for write support.

Ok, that's my problem, I don't have a root server, so it's not possible to change settings...

My hoster can't change that too, as I have the wrong package...

Thanks for your help...
