## CalDav - 403 forbidden

Posted by scylor - 2012/04/17 06:01

---

Hey, everytime I try to use Rainlendar with Caldav I get: 403 - forbidden.

I've tried the exact same data I give to Rainlendar with thunderbird and my Android smartphone as well - it works. Only Rainlendar is giving me trouble.

I've tried:

<https://meinname.synology.me:5006/home/CloudStation/Kalender/>

<https://192.168.1.xxx:5006/home/CloudStation/Kalender/>

but none of thats works.

Any idea how to fix this?

Thanks in advance.

Rainlendar does not support CalDAV.

Wait... I thought CalDav basically was WebDav for calendars? Rainlendar can handle WebDav, right? So... How does that even work? Using a calendar via WebDav and not using CalDav??? oO

WebDAV is a protocol to store files to a webserver. CalDAV was created on top of that for calendar events. Rainlendar supports WebDAV where all the events are stored to a single \*.ics file but not CalDAV where each event is a separate file.
