## CalDav Support?

Posted by nm78 - 2012/05/10 07:58

---

Hi, im used Rainlendar since 5 Years. Now im migrated my calendars to owncloud. The sync works very fine with Thunderbird Lightning and Android via the CalDAV Protocol.

Now i would integrate my calendars into my desktop using rainlendar and it dont works. :-(

Can u tell me, when the caldav support for rainlendar is planned?

That is something I'm considering for the Rainlendar v2.11 but I haven't made any decisions yet.

@Rainy

Are there any news meanwhile?

I'm also using owncloud.

To have private data under your own control and not everything at google/facebook/... is important.

As CalDav is something like a standard for calendar data currently rainlendar support would be appreciated by many users.

Are there any news meanwhile?

I'll look into this after I get 2.10 released.

Hallo,  
Is there anything new on this topic?  
The caldav support with Owncloud is a must, if I have to pay for a calendar.  
Nikolaus

I'm working on the CalDAV support and the initial version of the plugin should be available with the next Rainlendar beta build (whenever that gets released).

Hi,  
the current Rainlendar version 2.11 has a CalDAV plugin, but I am unable to sync with my ownCloud server. I always get the error "The url xyz does not contain any calendars". Syncing works fine with eM Client and CalDAV-Sync on my android phone. Is owncloud not yet supported or is there something wrong with my configuration?

Rainlendars CalDav Implementation works well with owncloud (actual version 4.5)

I just installed the new rainlendar version (2.11) to check CalDav functionality.

Of course owncloud setup is not described in the help pages, but reading how it works with icloud gives the idea for owncloud.

@drehtuer: on the first run it didn't work either, but rainlendar gave me a hint that the empty calendar does not exist on owncloud, but a "default calendar" would exist. And that's it. Maybe you have a problem with the correct url? Look at owncloud cal, should be something like <http://cookyr.de/owncloud/remote.php/caldav/principals/cooky/>.

@Rainy: great job! Thx! !!!

---

@cookyr: Thank you for your reply, but I am still unable to connect to the server. Instead of one "default calendar" I have multiple calendars stored on the server.  
I tried both accessible URLs to no avail:  
<https://owncloud/remote.php/caldav/calendars/>  
<https://owncloud/remote.php/caldav/principals/>

Rainlendar recognize "default calendar" as , but offers only an empty drop down list for the calendar names. The actual name of the calendars on the server are recognized and I receive the "url does not contain any calendars" error.  
Using any arbitrary string as and ending the whole URL with "/default calendar" will also trigger the empty drop down list.

Can you run Rainlendar in the debug mode and send the debug log to me (use the Rainlendar's support address and include a link to this post)? I can check from the log what exactly the server is replying to Rainlendar when it tries to read the calendars.

---

## Re:CalDav Support?

---

According to the logs the server sends a "417 - Expectation Failed" response. A short trip to google reveals that this is a known lighttpd bug that won't be fixed in the stable 1.4 branch <http://redmine.lighttpd.net/issues/377>

Time to try a new http server I guess ...

## Re:CalDav Support?

Posted by Rainy - 2013/02/03 07:09

---

There is a workaround for the lighttpd issue in Rainlendar but unfortunately it's only for the network shared calendar and not in CalDAV plugin. I can add the same implementation to CalDAV too in the next version.

The workaround is to set the "dontSendContinue=0" in Rainlendar's settings file to "dontSendContinue=1" which will remove the "Expect:" header from the request.

---

## Re:CalDav Support?

Posted by drehtuer - 2013/02/03 08:19

---

I switched to apache, now everything works as expected.

My Rainlendar config file does not have a "dontSendContinue" option, in which category should this option be added if one would continue to use lighttpd?

---

## Re:CalDav Support?

Posted by Rainy - 2013/02/08 01:37

---

The setting is currently shown only under the "Network Shared Calendar" section if there are any calendars with that type.
