
Rainlendar default calender app in Ubuntu

Posted by J.One - 2012/05/16 12:47

I was wondering if its possible to make Rainlendar the default calender app in Ubuntu? So if I click on the time, I get my trusted Rainlender calender and not the other one (I don't use).

I found how to change the calender to other apps, but not to specifically to Rainlender. When I look in "default apps" under the tab "calender" Rainlendar is not selectable.

I think the "Add event..." will always open Evolution or at least I couldn't find any way to change that (please correct me if I'm wrong). Adding Rainlendar to the default applications can be done which at least would allow it to import the *.ics files automatically when they are double clicked. I'm not really sure if there is something else that the default application affects too. I'll make the necessary changes for Rainlendar to appear in the default applications list for the next build.

" I'll make the necessary changes for Rainlendar to appear in the default applications list for the next build."

Thank you very much for that!
I will wait for the next build. (great customer support btw)
